Carried out on 17/07/2020 by Klaudia Plach
Nurse Sabrina Peruzzo

ANGIO-CT SCAN ABDOMEN (exam performed on 18/07/2020)

Abdominal aorta and iliac-femoral axes within limits

Regular appearance, course and caliber of the splanchnic branches of the aorta; anatomic variant with appearance of the right hepatic artery from the superior mesenteric is reported. With reference to the clinical picture, with angio-CT scan the internal iliac artery and their main branches are patent and with conserved caliber, in particular patent and with regular appearance course and caliber are those for the pelvic floor, the internal pudendal artery is also regular, without images referable to stenosis, kinking or aneurysmal dilatations.

The t testicular arteries are also within the appearance limits from the aorta, course and caliber.

Metallic spiratine (from varicocele treatment outcomes) along the branching course of the left testicular vein in planes passing through S1. Slight greater width of the vessels of the right pampiniform plexus to the proximal third of the scrotum (maximum caliber 4 mm. without reaching criteria for varicocele).

No pathological findings on the parenchymatous organs of the upper abdomen and the retroperitoneum.

No significant adenomegaly or abdominal-pelvic fluid flaps

Almost empty bladder, with preserved thick walls

Prostate within the limits as to size, contains millimetre calcification in the right peri-urethral site.

The resident physician
Dr. Aniello Savino

The radiologist
Dr. Benedetta Giorgi
